Claims 1-9 (Canceled):

Claim 10 (Currently Amended): A digital camera, comprising:

an imaging device for outputting, at a rate of one screen per a first period, a first image signal of a first resolution which corresponds to an optical image of an object scene;

a creator for creating [[an]] <u>a second</u> image signal corresponding to an optical image of an object scene every first period of a second resolution lower than the first resolution by subjecting the <u>first image signal outputted from said imaging device to a signal processing including a thinning-out process</u>;

a memory having a single input/output port and a plurality of memory areas;

a changer for changing a selecting of [[the]] a memory area at an interval of the first period;

a writer for writing the <u>second</u> image signal created by said creator to one of said plurality of memory areas based on a changing result of said changer;

a reader for reading the <u>second</u> image signal from another of said plurality of memory areas based on the changing result of said changer [[every]] at a rate of one screen per a second period which is one [[for]] <u>over</u> an integer of the first period; and

a displayer for displaying an image based on the <u>second</u> image signal read out by said reader, wherein said memory is an SDRAM, and said writer includes a buffer for holding the second image signal created by said creator, and a transferor for transferring the second image signal held by said buffer to said memory.

Claims 11 and 12 (Canceled).

Claim 13 (Previously Presented): A digital camera according to claim 10, wherein the number of the memory areas is two, and the second period is ½ of the first period.

Claim 14 (Previously Presented): A digital camera according to claim 10, wherein said changer changes the selecting of the memory area in a predetermined order.

Claim 15 (New): A digital camera, comprising:

an imaging device for outputting, at a rate of one screen per a first period, a first image signal of a first resolution which corresponds to an optical image of an object scene;

a creator for creating a second image signal of a second resolution lower than the first resolution by subjecting the first image signal outputted from said imaging device to a signal processing including a thinning-out process;

a memory having a single input/output port;

a writer for writing the second image signal created by said creator to said memory;

a reader for reading the second image signal from said memory at a rate of one screen per a second period which is shorter than the first period; and

a displayer for displaying an image based on the second image signal read out by said reader, wherein said memory is an SDRAM, and said writer includes a buffer for holding the second image signal held by said buffer to said memory.
